Applications & Materials

Ferrites are dense, homogenous ceramic structures made by mixing iron oxide with oxides or carbonates of one or more metals such as zinc, manganese, nickel or magnesium. They are pressed, then fired in a kiln at 1,000 - 1,500°C and machined as needed to meet various operational requirements. Ferrite parts can be easily and economically molded into many different geometries. A diverse set of materials, providing a range of desired electrical and mechanical properties, are available from Magnetics.

Magnetics' ferrite cores are manufactured for a wide variety of applications. Magnetics has the leading MnZn ferrite materials for power transformers, power inductors, wide-band transformers, common mode chokes, as well as many other applications.

ADVANTAGES OF MAGNETICS' FERRITES

- The widest range of toroid sizes in power and high permeability materials
- Superior toroid coatings available in epoxy and Parylene C
- Standard gapping to precise inductance or mechanical dimension: wide range of coil former and assembly hardware available
- The full range of standard planar E and I cores
- Rapid prototyping capability for new development

FERRITE APPLICATIONS

APPLICATIONS	DESIRED PROPERTIES	PREFERRED MATERIALS	AVAILABLE SHAPES
Broadband Transformers	Low loss, high μ . Good frequency response.	J, W, M	Pot cores, Toroids, E, U & I cores, RM cores, EP cores
Common Mode Chokes	Very high μ (permeability).	J, W, M	Toroids, E Cores
Converter and Inverter Transformers	Low losses, high saturation.	F, L, P, R, T	Toroids, E, U & I cores, Pot cores, RS cores, Planar cores
Differential Mode Inductors	Low losses, high temperature stability, good stability across load conditions.	F, P, R, T	Gapped Pot cores, EP cores, E cores, RM cores, Planar cores, PQ cores
Linear Filters and Sensors	Good loss factor, linearity and temperature linearity at low drive level.	C, E, V	Pot cores, Toroids
Narrow Band Transformers	Moderate Q, high μ , high stability.	F, J	Pot cores, Toroids, RM cores, EP cores
Noise Filters	High μ , good frequency response.	J, W, M	Toroids
Power Inductors	Low losses at high flux densities and temperatures. High saturation. Good stability across load conditions.	F, L, P, R, T	Pot cores, E cores, PQ cores, RM cores, Planar cores
Power Transformers	High μ and low losses at high flux densities and temperatures. High saturation. Low exiting currents.	F, L, P, R, T	Ungapped Pot cores, E, U & I cores, Toroids, EP cores, RS cores, DS cores, PQ cores, Planar cores
Pulse Transformers	High μ , low loss, high B saturation.	J, W, M	Toroids
Telecom Inductors	Low losses, high temperature stability, good stability across load conditions.	F, P, R, T	Pot cores, EP cores, E cores, RM cores, Planar cores

Resistivity	10 ² -10 ³	ohm-cm			

R Material

A medium frequency multi-purpose power transformer, inductor and filter material. Widely available in shapes and toroids. Engineered for lowest losses between 90 - 100°C.

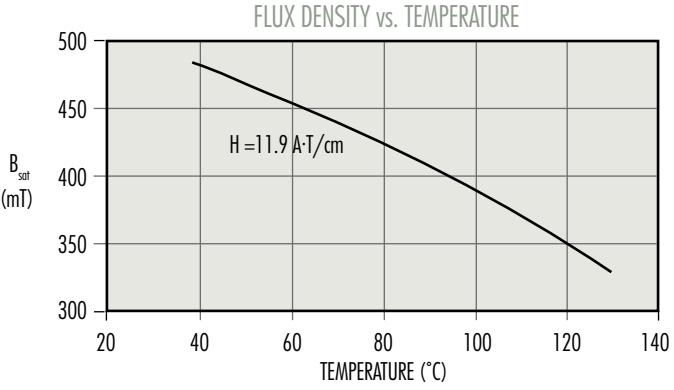

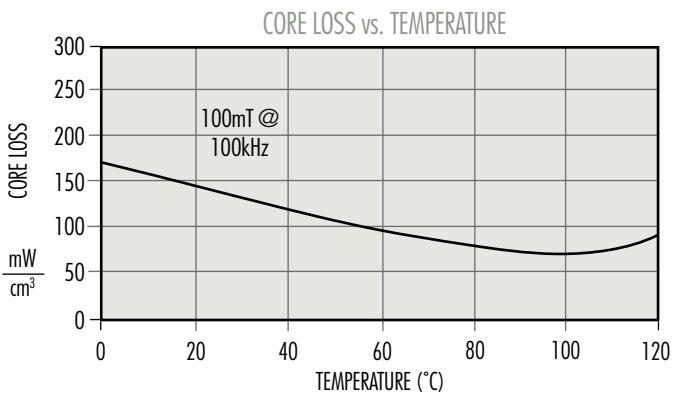

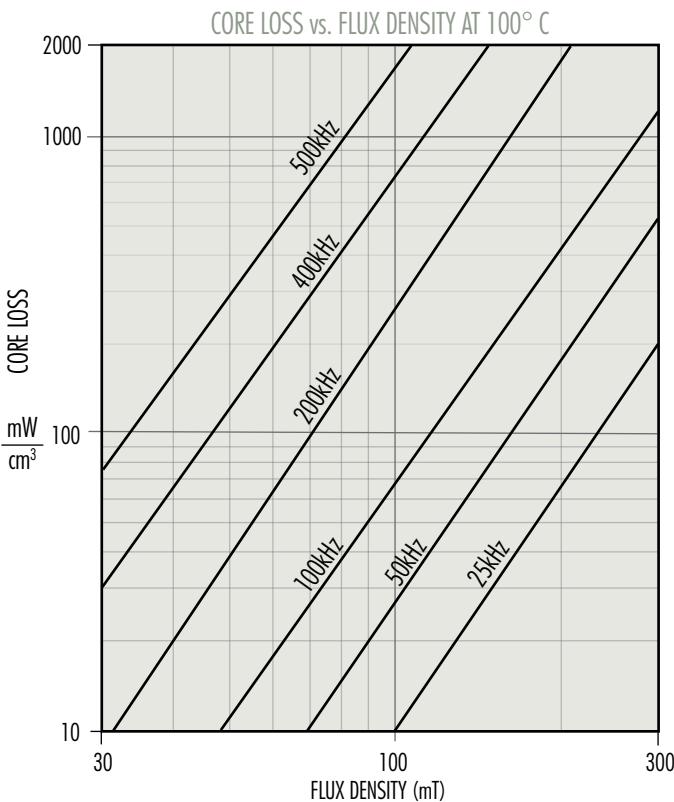

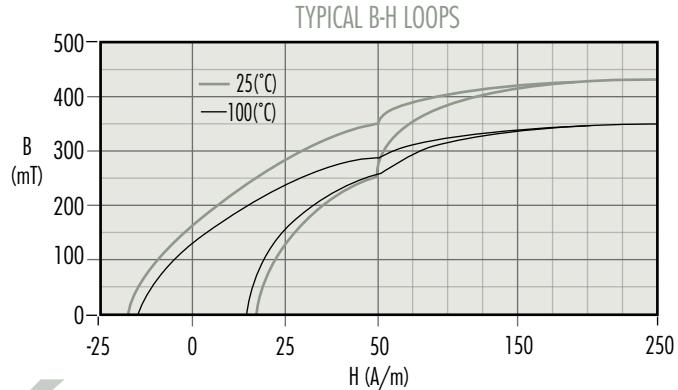

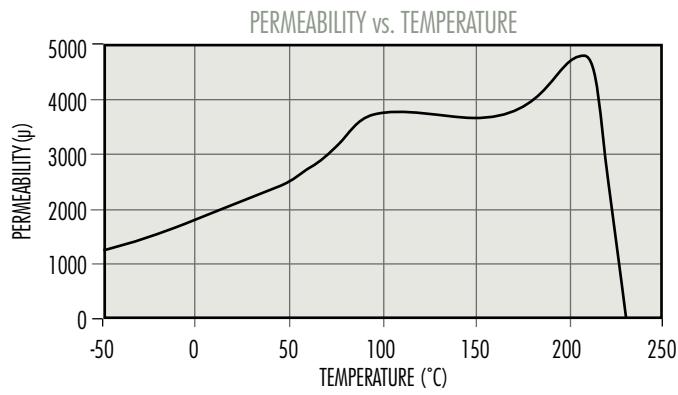

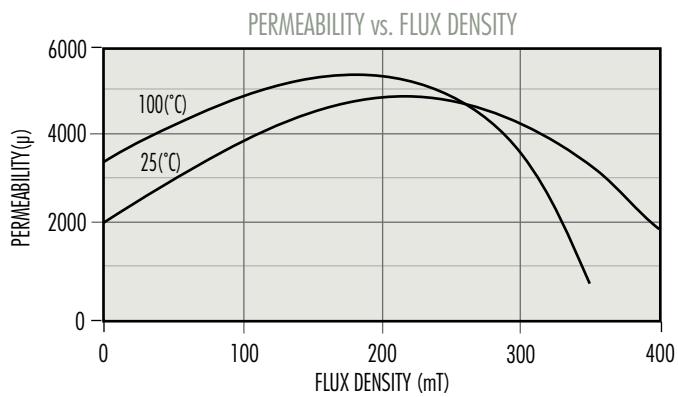

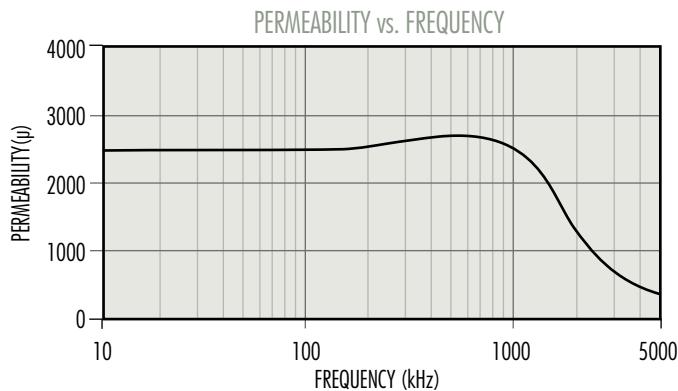

Initial Perm (25°C; ≤ 10 kHz)	$2,300 \pm 25\%$
Saturation Flux Density (4,700 G at 15 Oe, 25°C)	470 mT, 11.9 A·T/cm
Curie Temperature	210°C

P Material

A low-medium frequency general-purpose power converter material. Engineered for lowest losses between 80 - 100°C. Available in almost all core sizes and shapes.

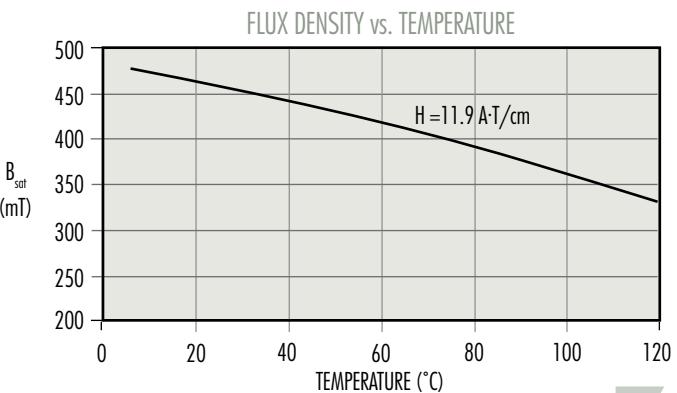

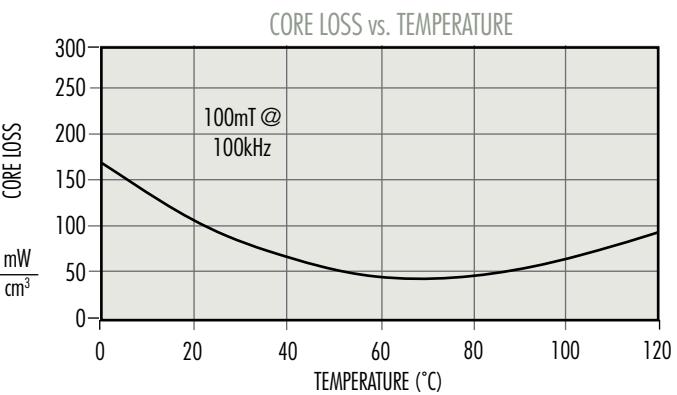

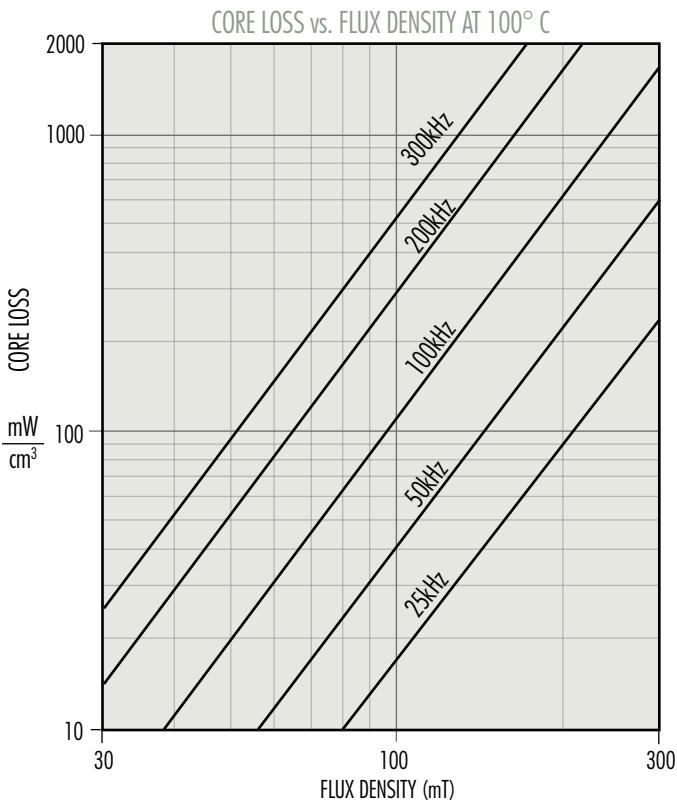

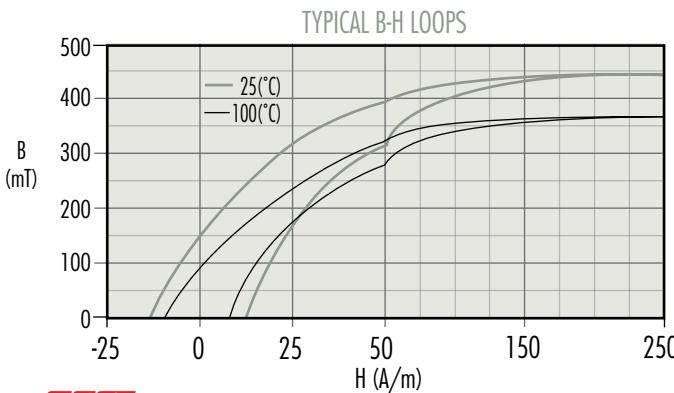

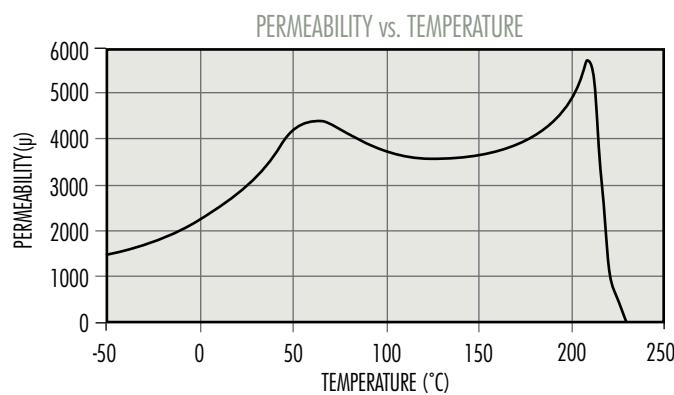

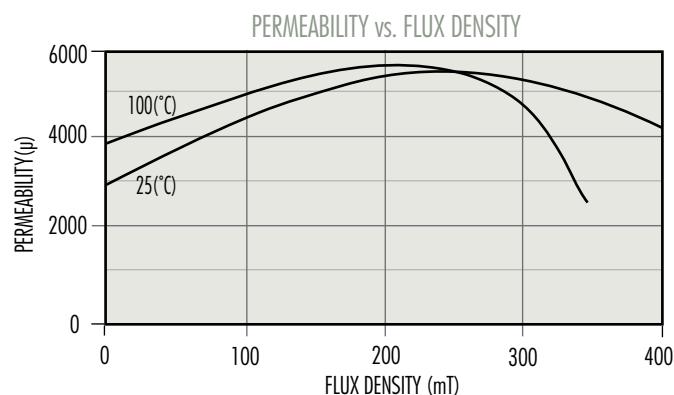

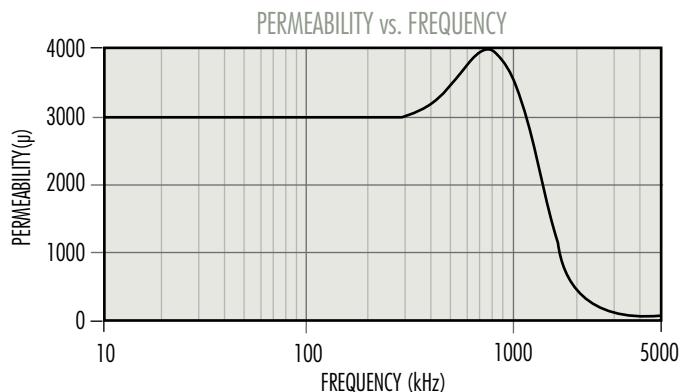

Initial Perm (25°C; ≤ 10 kHz)	$2,500 \pm 25\%$
Saturation Flux Density (4,700 G at 15 Oe, 25°C)	470 mT, 11.9 A·T/cm
Curie Temperature	210°C

F Material

A medium frequency general-purpose power transformer, inductor and filter material. Slightly higher in perm than P or R Material. Engineered for lowest losses between 50 - 80°C.

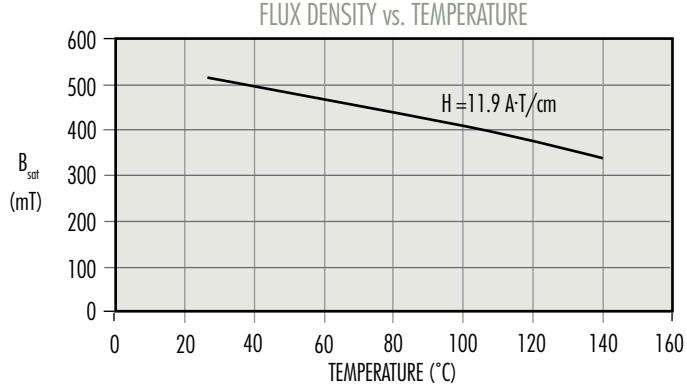

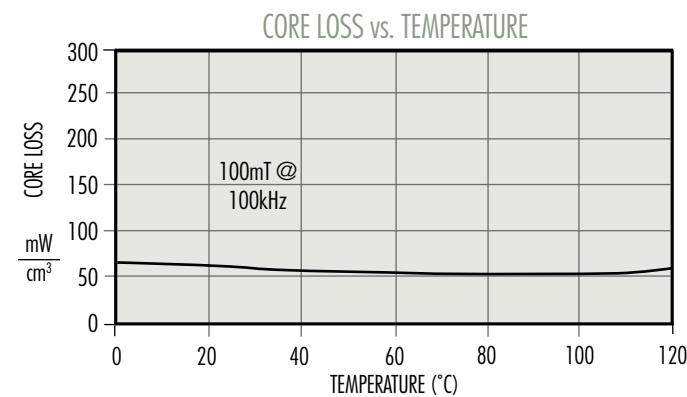

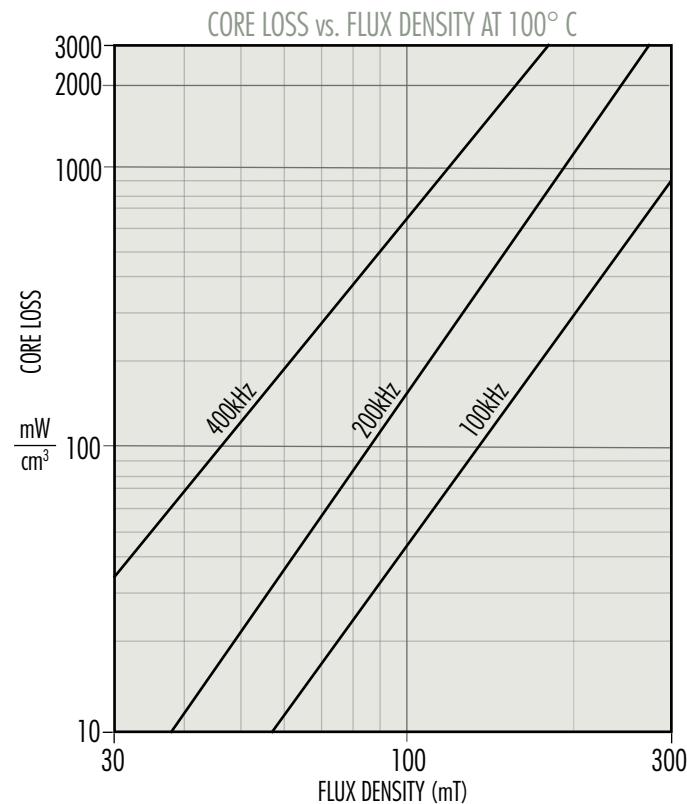

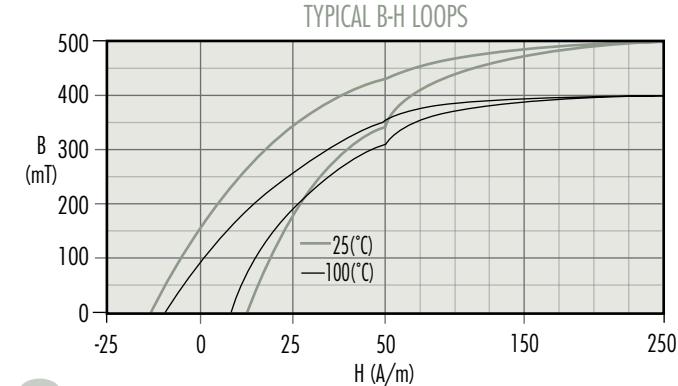

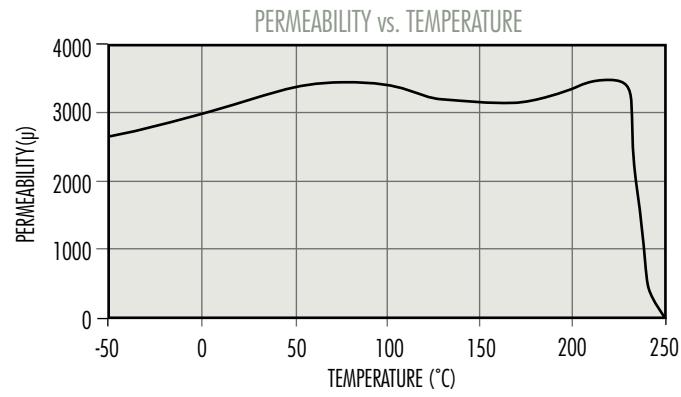

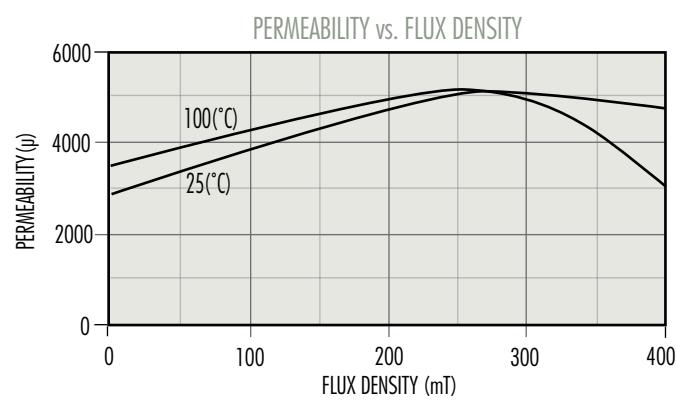

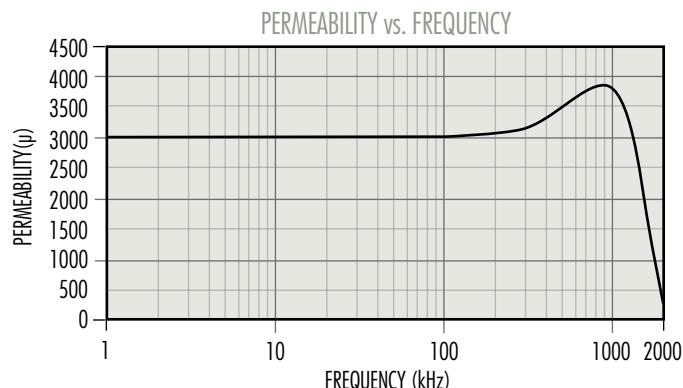

Initial Perm (25°C; ≤ 10 kHz)	3,000 ± 20%
Saturation Flux Density (4,700 G at 15 Oe, 25°C)	470 mT, 11.9 A·T/cm
Curie Temperature	210°C

T Material

A power material for transformers and inductors operating from 20 kHz to 750 kHz. T material offers stability in both perm and losses over a wide temperature range.

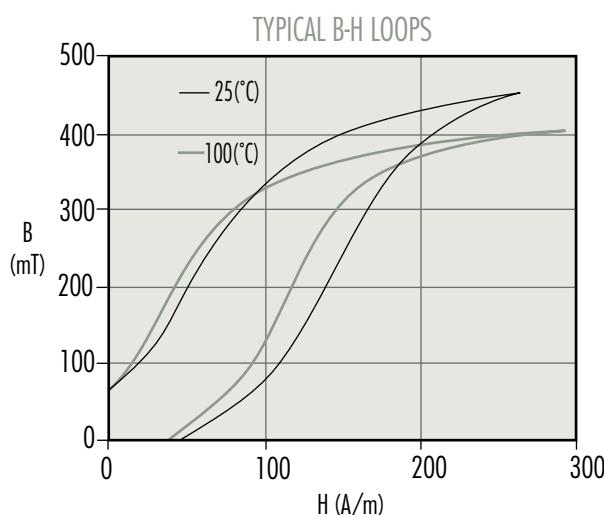

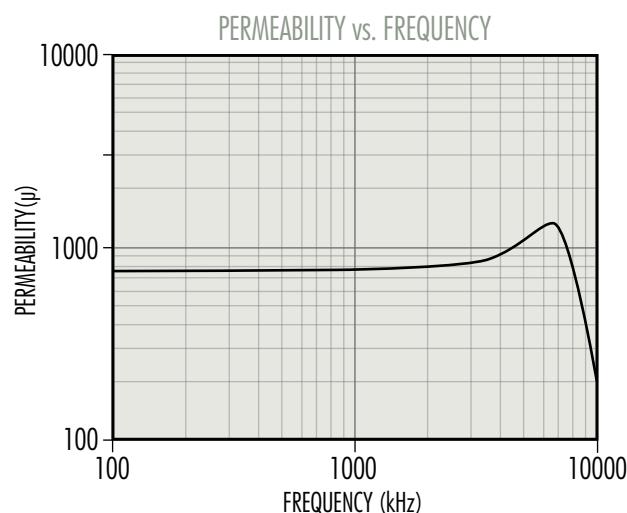

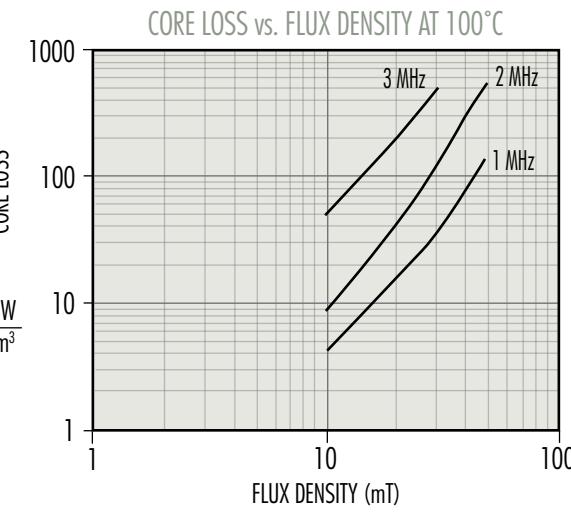

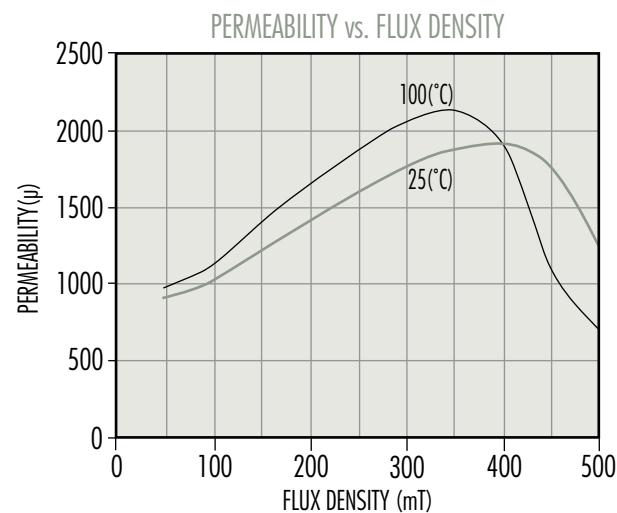

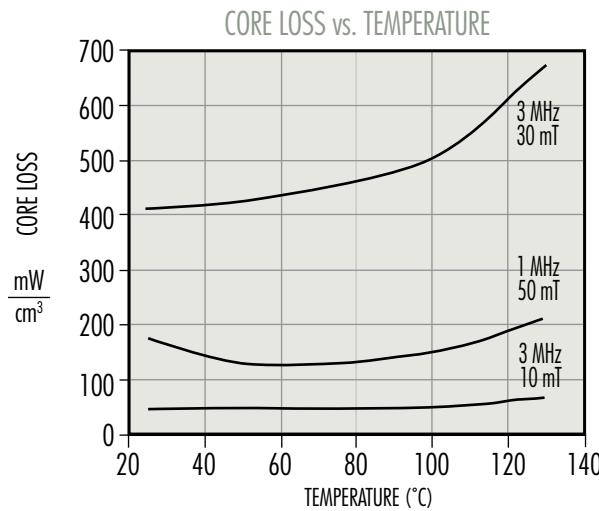

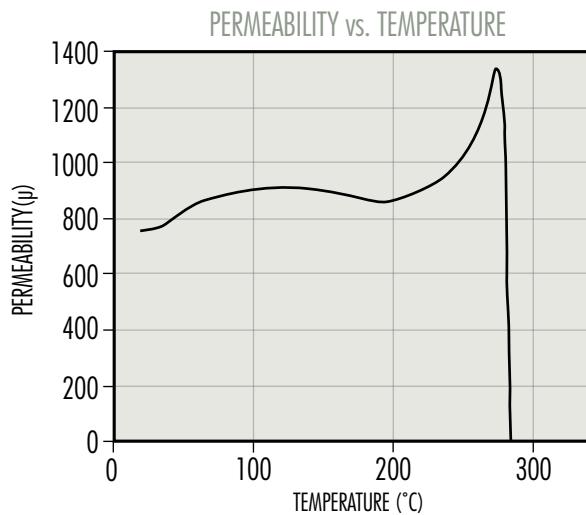

Initial Perm (25°C; ≤ 10 kHz)	$3,000 \pm 25\%$
Saturation Flux Density (5,300 G at 15 Oe, 25°C)	530 mT, 11.9 A·T/cm
Curie Temperature	220°C

L Material

A high-frequency high-temperature power material. L material is optimized for transformers and inductors from 500 kHz – 3 MHz. Core losses are minimized between 70 – 100°C.

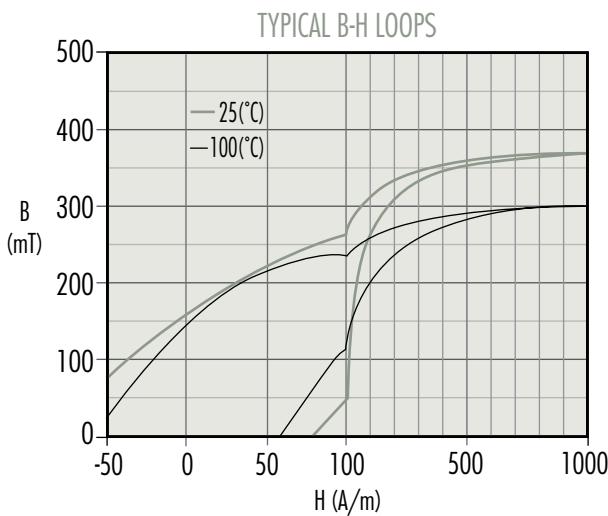

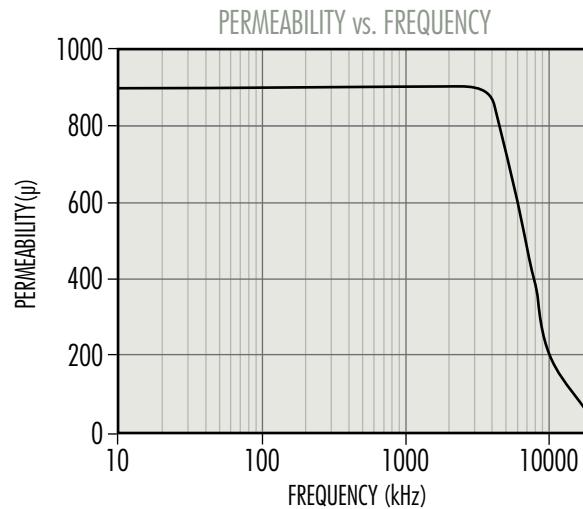

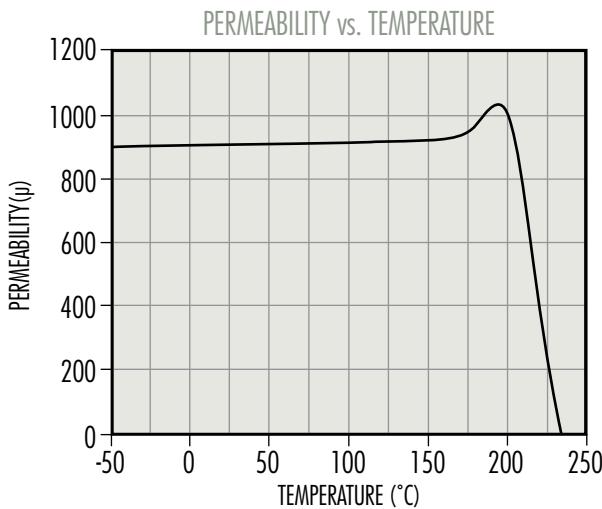

Initial Perm (25°C; ≤ 10 kHz)	750 ± 25%
Saturation Flux Density (5,200 G at 15 Oe, 25°C)	520 mT, 12 A·T/cm
Curie Temperature	280°C

C Material

C Material works well for Telecom Filters, Wideband, Matching and Pulse transformer applications, and High Q inductors.

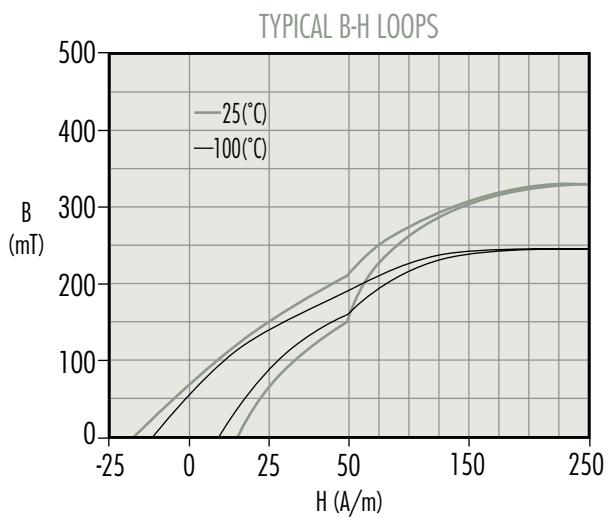

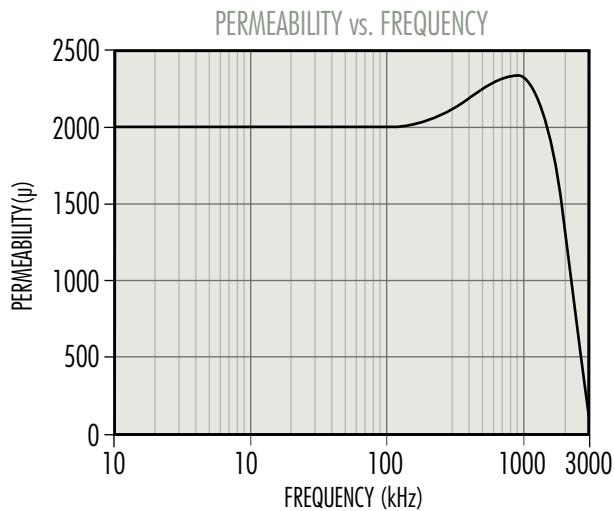

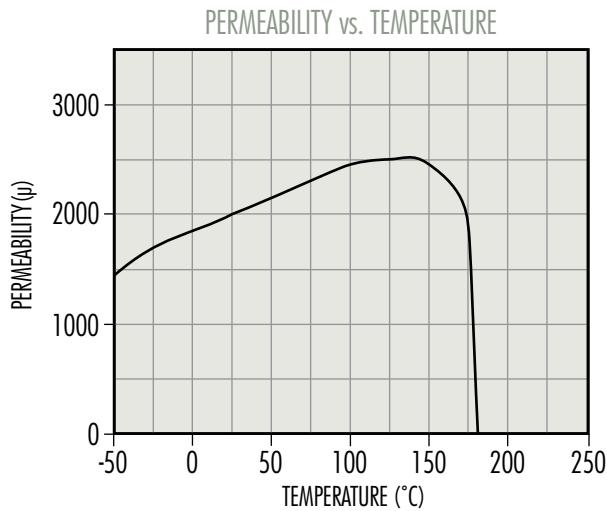

Initial Perm (25°C; ≤ 10 kHz), Uncoated	$900 \pm 25\%$
Saturation Flux Density	380 mT, 11.9 A-T/cm (3,800 G at 25°C, 15 Oe)
Curie Temperature	200°C

E Material

E Material works well for Telecom Filters, Wideband, Matching and Pulse transformer applications, and High Q inductors.

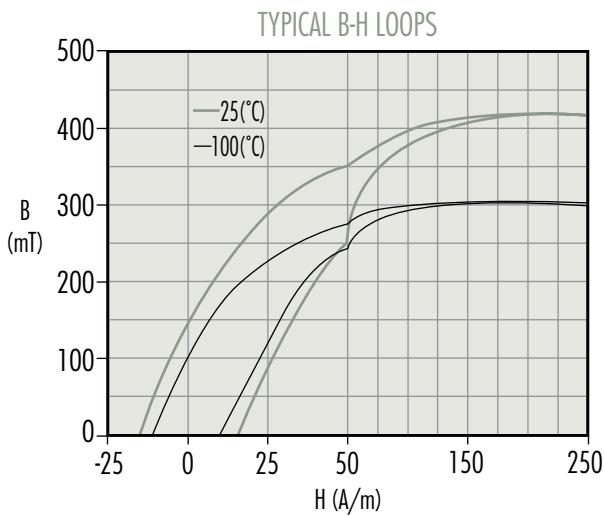

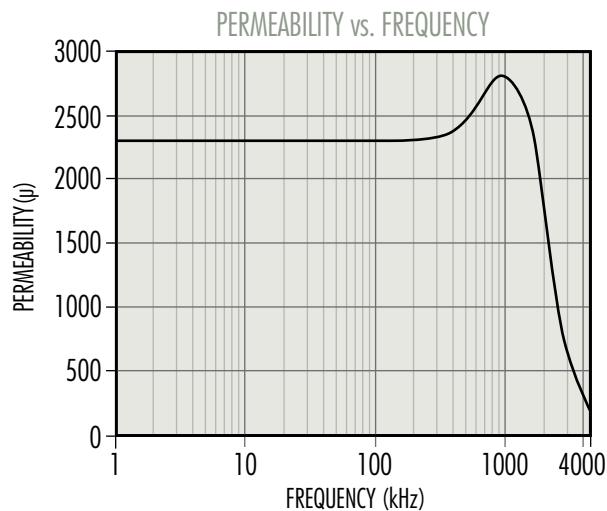

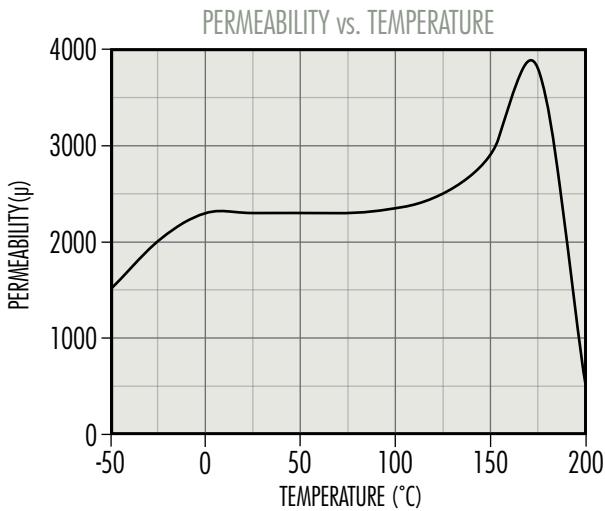

Initial Perm (25°C; ≤ 10 kHz), Uncoated	$2,000 \pm 25\%$
Saturation Flux Density.....	360 mT, 11.9 A-T/cm (3,600 G at 25°C, 15 Oe)
Curie Temperature	160°C

V Material

V Material works well for Telecom Filters, Wideband, Matching and Pulse transformer applications, and High Q inductors.

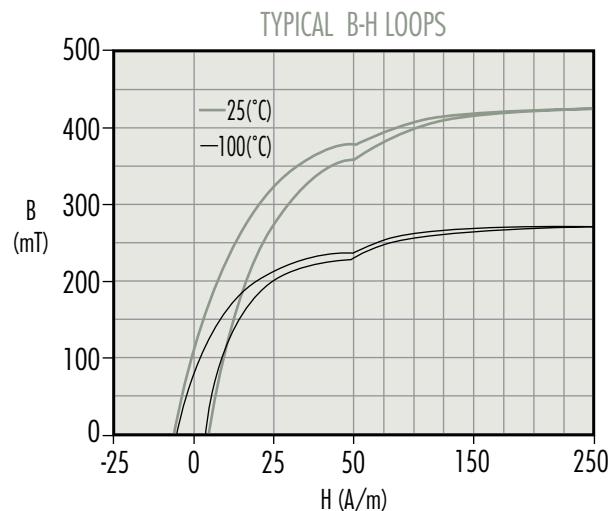

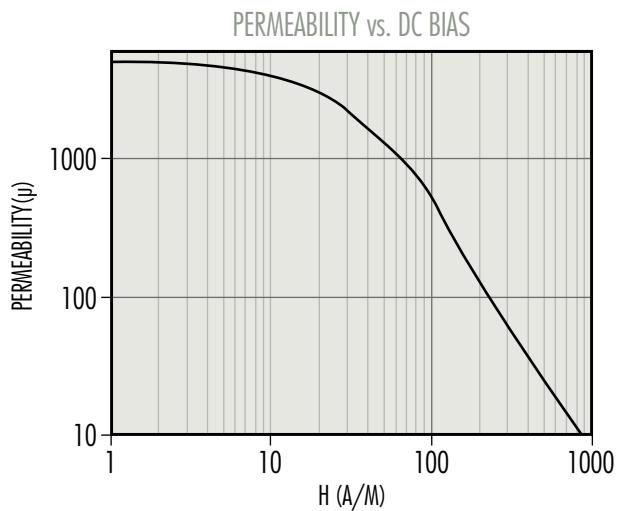

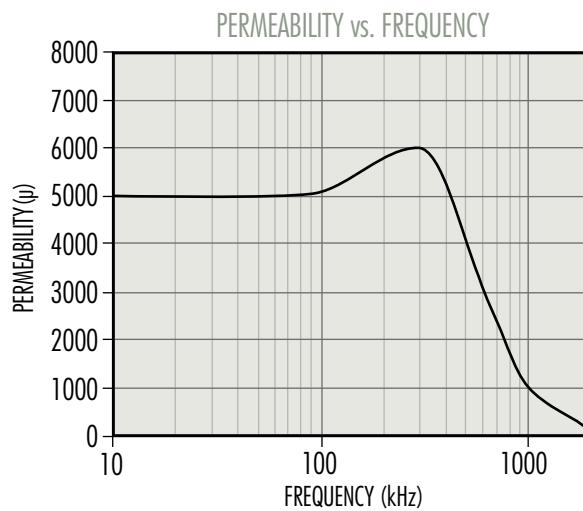

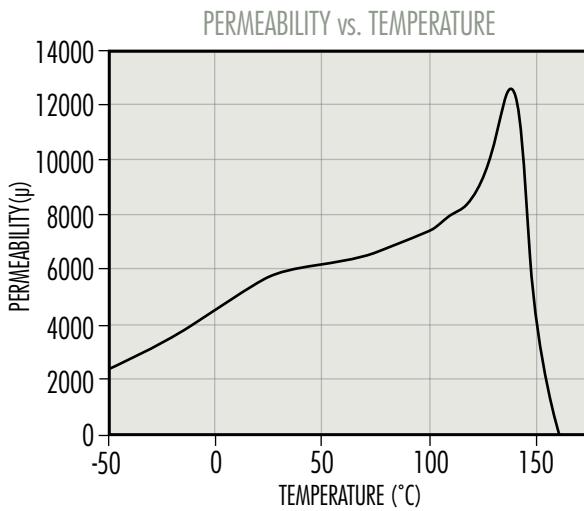

Initial Perm (25°C; ≤ 10 kHz), Uncoated	$2,300 \pm 25\%$
Saturation Flux Density.....	440 mT, 11.9 A-T/cm (4,400 G at 25°C, 15 Oe)
Curie Temperature	170°C

J Material

A medium perm general-purpose material. Well suited both for EMI/RFI filtering and broadband transformers.

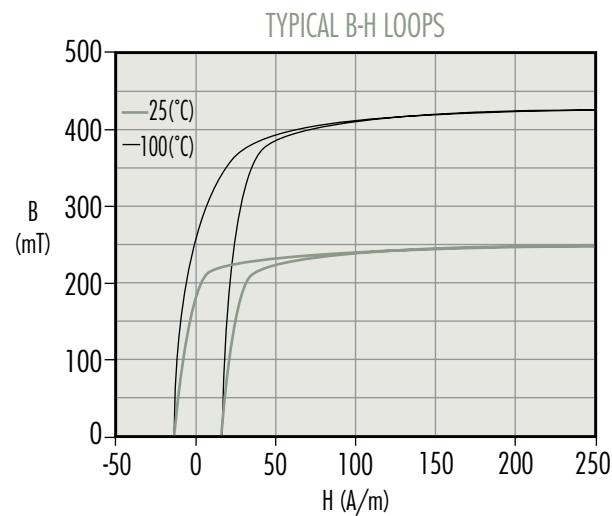

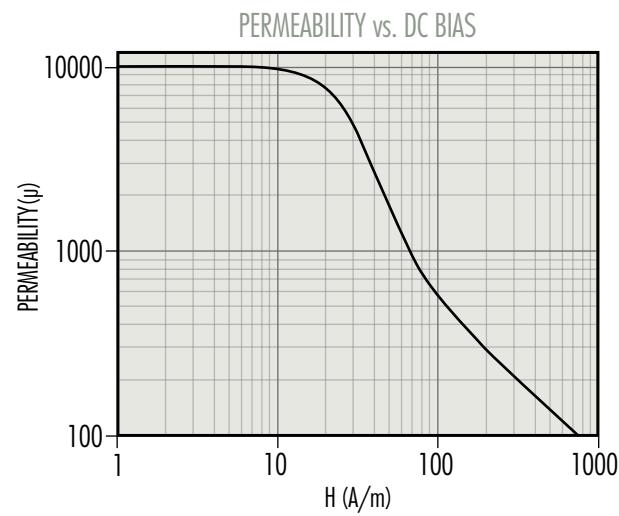

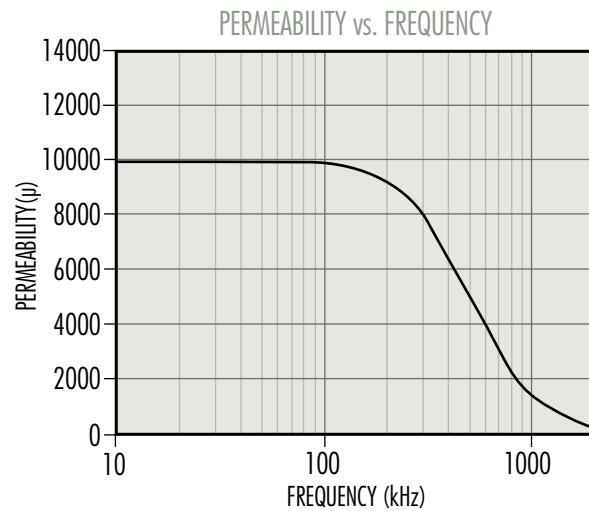

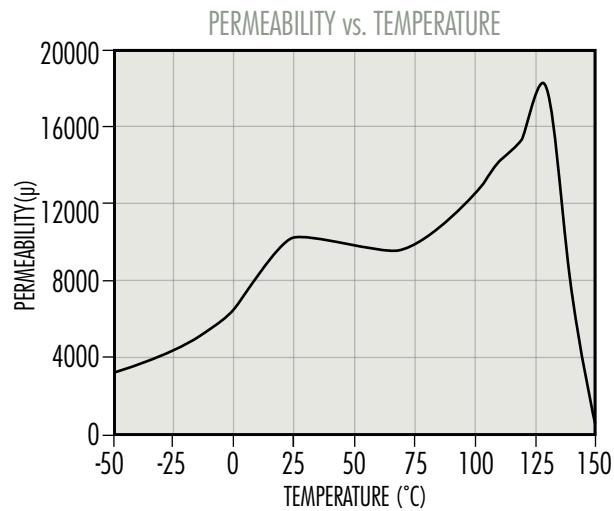

Initial Perm (25°C; ≤ 10 kHz)	$5,000 \pm 20\%$
Saturation Flux Density (4,300 G at 15 Oe, 25°C)	430 mT, 11.9 A·T/cm
Curie Temperature	145°C

W Material

A high permeability material used for EMI/RFI suppression, common mode chokes, pulse and broadband transformers.

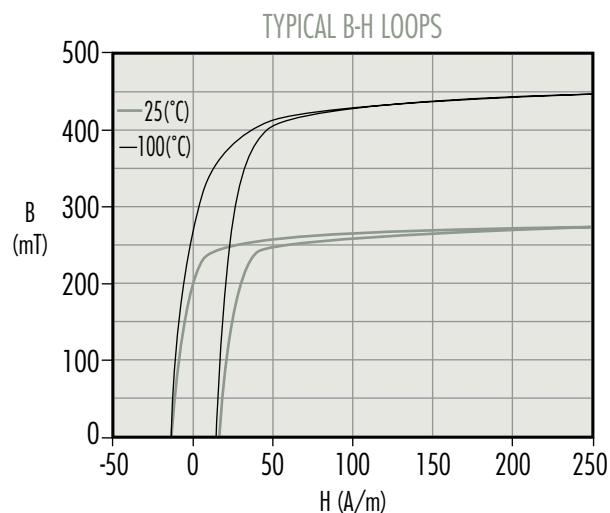

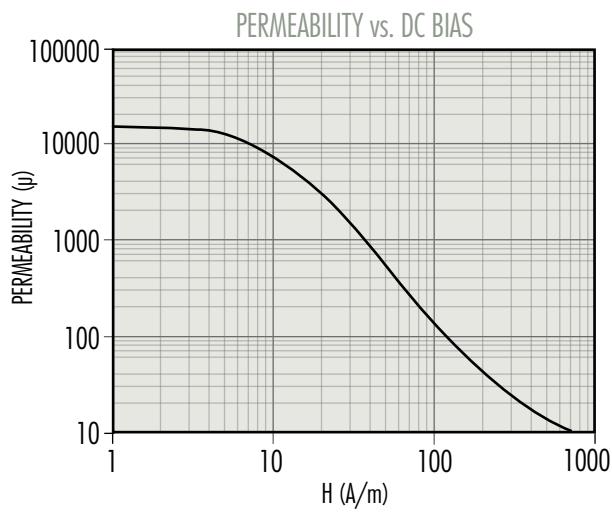

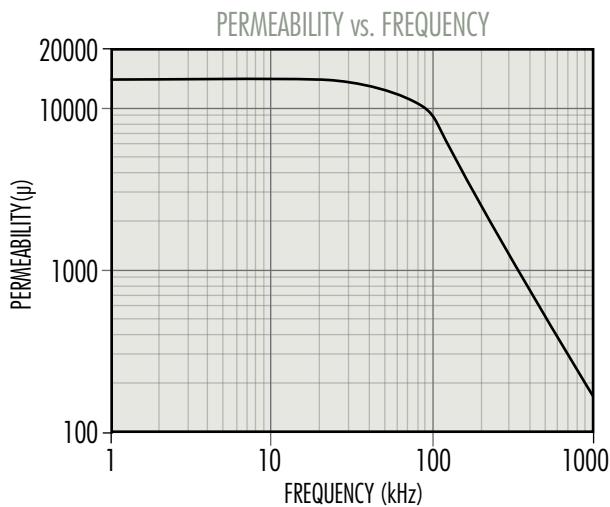

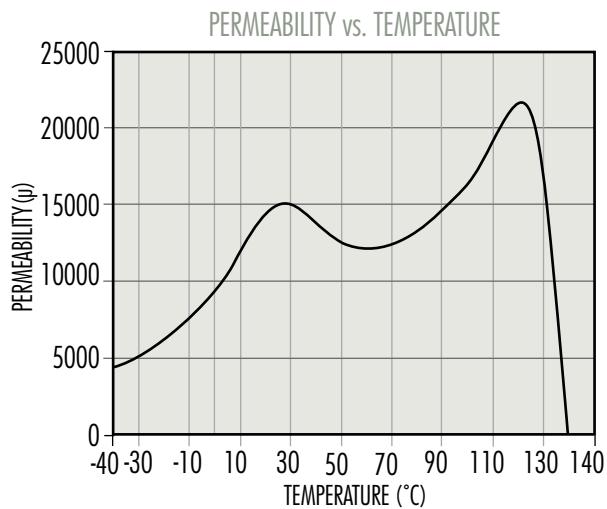

Initial Perm (25°C; ≤ 10 kHz)	$10,000 \pm 30\%$
Saturation Flux Density (3,900 G at 15 Oe, 25°C)	390 mT, 11.9 A·T/cm
Curie Temperature	135°C

M Material

Highest permeability material used for EMI/RFI suppression, common mode chokes, pulse and broadband transformers.

Initial Perm (25°C; ≤ 10 kHz)	$15,000 \pm 30\%$
Saturation Flux Density (4,700 G at 15 Oe, 25°C)	470 mT, 11.9 A·T/cm
Curie Temperature	130°C

Gapped Cores

How To Order

Part Number

Gap Code

The letter indicates the type of gap and a three-digit number defines the value.

CODE	MEANING	EXAMPLE
A---	A_L (if <1000)	DF42311 A275 ($A_L=275$)
X---	A_L if 1000 or greater (add 1000 to code)	OP44721 X250 ($A_L=1250$)
F---	A_L if <100, non-integer (divide code by 10)	OR42510 F807 ($A_L=80.7$)
G---	Depth of Grind in mils (1000 ^{ths} of an inch)	OF44317 G079 (Gap=0.079")
M---	Depth of Grind , mm (divide code by 10)	OF43019 M015 (Gap=1.5 mm)

A_L is inductance factor, mH/1000 Turns, or nH/T².

Either the A_L or the depth of grind (not both) is controlled during production of gapped cores.

See the chart on pages 17-19 for tolerances.

Gap-to-Gap vs Ungapped-to-Gap Core Sets

"Gap-to-gap combination" means the gap is symmetrical. Half of the total gap is removed from each piece.

"Ungapped-to-gap combination" means an asymmetrical gap; the entire gap is taken from one piece, and the other piece is ungapped.

For an E-core gapped to an A_L value when mated with the standard I-core, add "-EI" to the end of the part number.

Gapping for A_L

Inductors are commonly designed with an airgap in the magnetic path where the center legs or center posts of two ferrite pieces meet. This airgap allows the inductance to be controlled to a tight tolerance, and it allows the inductor to support a defined level of DC current without saturating. Inductors are commonly designed with an airgap in the magnetic path where the center legs or center posts of two ferrite pieces meet. This airgap allows the inductance to be controlled to a tight tolerance, and it allows the inductor to support a defined level of DC current without saturating. In most applications, defining the gap with the A_L results in inductors with the least variation.

When specifying and ordering E cores (including EC, EFD, EER, ETD, and Planar E cores) gapped to an A_L , it is important to note which cores are produced in gap-to-gap combination, because two gapped pieces are assembled to achieve the A_L . Alternatively, for E cores provided ungapped-to-gap, an ungapped piece must be used with a gapped piece to achieve the A_L . Pot, RS, DS, RM, PQ, and EP cores are sold as sets whether the combination is gap-to-gap or ungapped-to-gap.

A_L testing and limits are calculated to three significant digits based on the nominal value. For example, $A_L=99\pm3\%$ is interpreted as 96.0 Minimum, 99.0 Nominal, and 102.0 Maximum.

Magnetics tests gapped A_L values with full bobbins, usually 100 turns, or 250 turns for deep gaps. The drive level is low (0.5 mT) and the frequency is set low enough to avoid resonance effects. Measured inductance in an application may vary significantly from the theoretical value due to low turns, low bobbin fill, leakage effects, resonance effects, or elevated drive levels.

It is important for users to verify the correlation between the test of the core and the specific test being applied to the inductor or transformer. Planar E cores, Planar RM, and Planar PQ cores are especially susceptible to correlation discrepancies.

Gapping for Depth of Grind

Even though controlling A_L is usually the way to get the best consistency in finished inductor performance, in some cases the best results are seen when the depth of grind is specified instead. This is generally in cases where the gap dimension is quite large (the A_L is low), because variation in the inductance of the wound device is dominated by variation in the windings, especially if the number of turns is low.

For parts ordered in pieces (E cores), the depth of grind is given for each piece. To make an ungapped-to-gap set, use one piece of each. For example, use OR41808G050 with OR41808EC for an asymmetrical gap of 0.050"±0.001. For the same gap, but symmetrical, use two pieces of OR41808G025.

For parts ordered in sets, the depth of grind is given as a total for the set, and may be ungapped-to-gap core pieces or gap-to-gap.

Gapped Cores

Depth of Grind Tolerances

Chart shows type of combination and the guaranteed tolerance for corresponding A_L ranges. Ranges indicated are the tolerances for standard gaps. For $\pm 5\%$, $\pm 7\%$, and $\pm 10\%$, the maximum A_L for each is shown. Standard cores are manufactured to the smallest allowed tolerances. EE and EI tolerances are identical.

Toroids

2.54 mm – 12.7 mm

Ferrite toroids offer high magnetic efficiency as there is no air gap, and the cross sectional area is uniform. Available in many sizes (O.D. from 2.54 mm to 140 mm) and materials (permeabilities ranging from 750 to 15,000), this section lists common sizes.

Typical applications for high permeability toroids (J, W, and M materials) include common mode chokes, broadband transformers, pulse transformers and current transformers. L, R, P, F and T material toroids are excellent choices for high frequency transformers.

E, I Cores

9 mm – 35 mm

E cores are less expensive than pot cores and have the advantage of simple bobbin winding plus easy assembly. E cores do not, however, offer self-shielding. Lamination size E cores are available to fit commercially offered bobbins previously designed to fit the strip stampings of standard lamination sizes. Metric and DIN sizes are also available. E cores can be pressed to different thicknesses, providing a selection of cross-sectional areas. E cores can be mounted in different directions and, if desired, provide a low profile.

Typical applications for E cores include differential mode, power and telecom inductors, as well as broadband, power, converter and inverter transformers.

HOW TO ORDER

OR 43007 EC

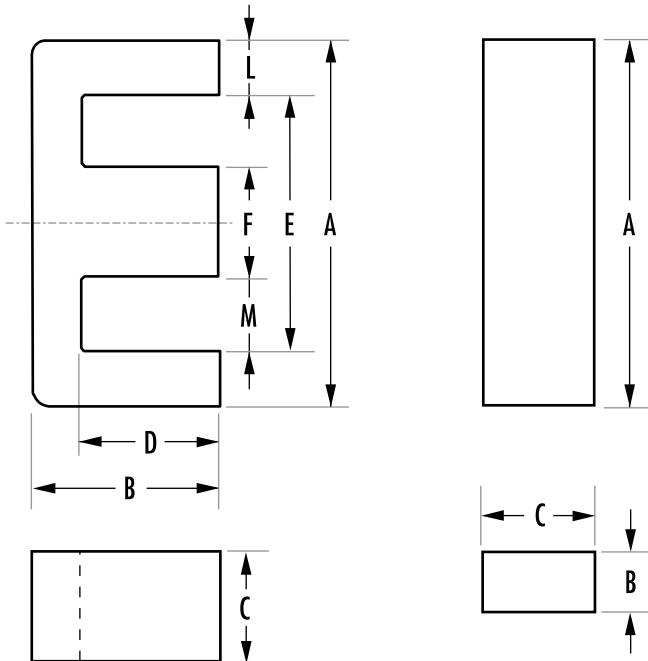

Shape code
Ferrite core material
Used for all ferrite types
Approximate length in mm
Approximate height in mm
Geometry code

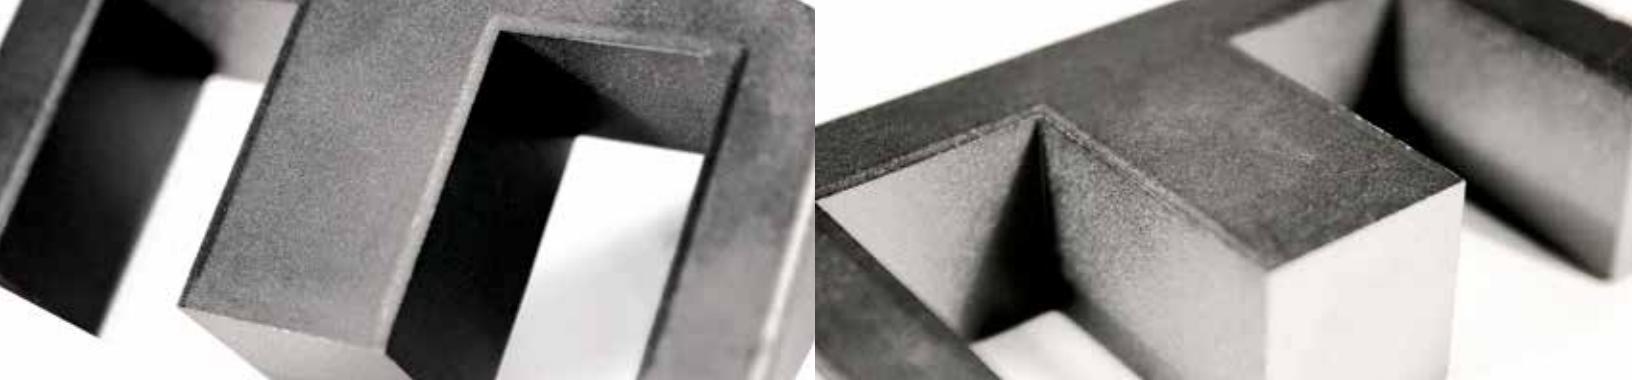

GEOMETRY CODE

EC – E core
IC – I core

Cores are sold per piece (for sets multiply by 2).
See page 18 for information on gapped cores.

For an E-core gapped to an A_L value when mated with the standard I-core, add “-El” to the end of the part number.

HOW TO ORDER

OR 47228 EC

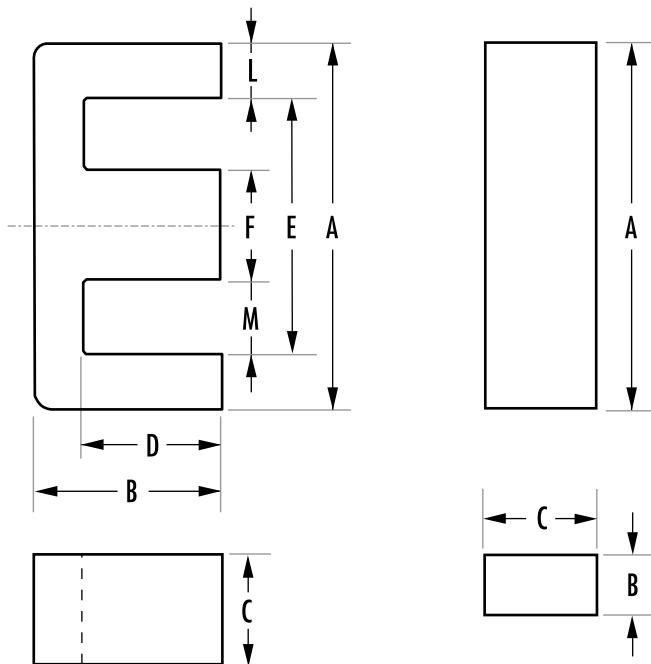

Shape code
Ferrite core material
Used for all ferrite types
Approximate length in mm
Approximate height in mm
Geometry code

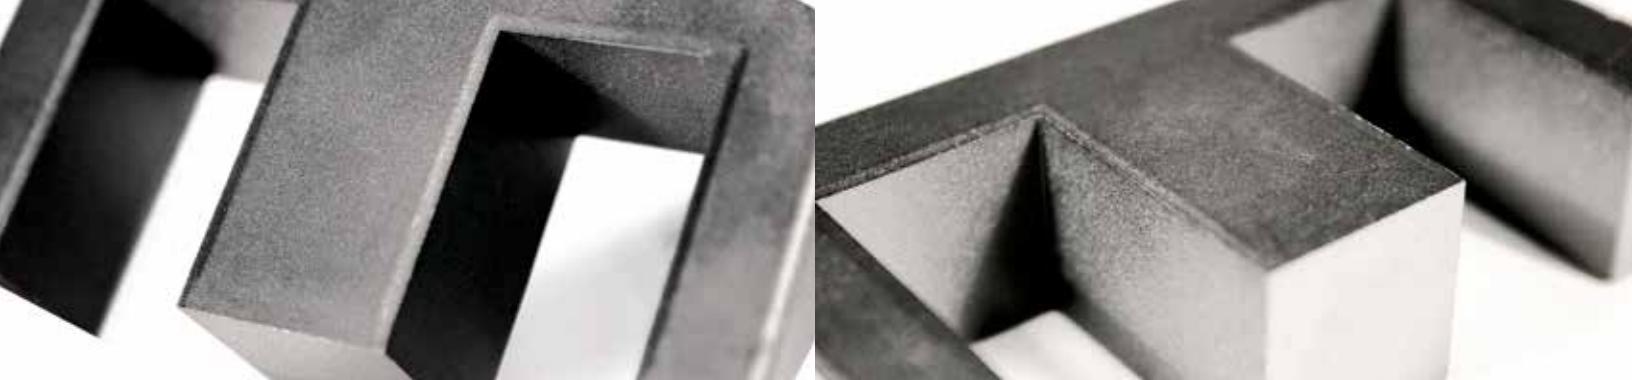

GEOMETRY CODE

EC – E core
IC – I core

Cores are sold per piece (for sets multiply by 2).
See page 18 for information on gapped cores.

For an E-core gapped to an A_L value when mated with the standard I-core, add “-El” to the end of the part number.

Planar E, I Cores

14 mm – 36 mm

Planar E cores are offered in all of the IEC standard sizes and a number of other sizes. The leg length and window height (B and D dimensions) are adjustable for specific applications without new tooling. This permits the designer to adjust the final core specification to exactly accommodate the planar conductor stack height with no wasted space. Clips and clip slots are available in many cases, which is useful for prototyping. I cores are also offered standard, reducing path length and increasing inductance. Planar cores provide the lowest profile design. E-I planar combinations allow practical face bonding in high volume assembly. The flat back can accommodate a heat sink.

Differential mode inductors, DC/DC, and AC/DC converters are typical applications for planar cores.

ER Cores

ER cores are a cross between planar E cores and pot cores. The round center post of the ER core offers minimal winding resistance. In addition, they offer better space utilization and shielding than with rectangular center leg planar cores. When compared with non-planar cores, ERs offer minimal height and better thermal performance. E/I combinations facilitate economical assembly.

Typical applications of ER cores include differential mode inductors and power transformers.

U, I Cores

U cores are ideal for many power transformer applications. The long legs support low leakage inductance designs and facilitate superior voltage isolation. U/I combinations provide for economical assembly.

UR Cores

UR cores are an excellent choice for high current designs and conditions where vibration occurs. The open window area accommodates large conductors. Holes through the center or grooves on the outer legs of the core provide a method to secure the core to the PCB with mounting hardware.

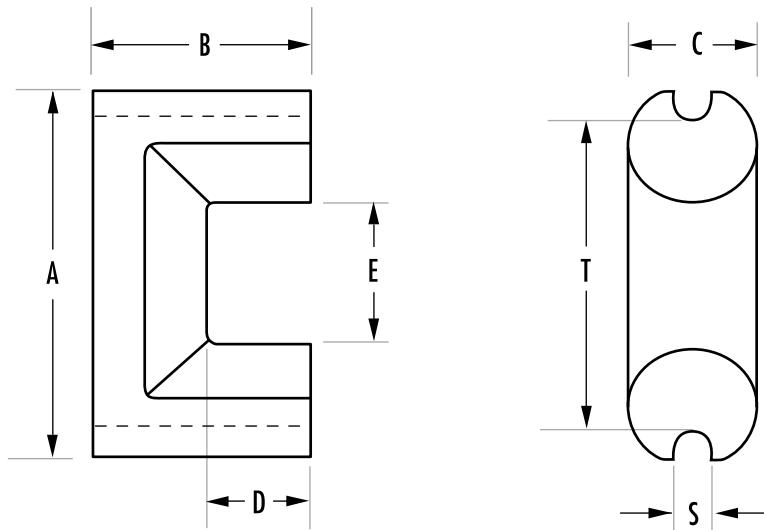

Typical applications include welding output transformers, audio amplifiers, traction, and other high-voltage power transformers.

EC Cores

The round center leg and open window of EC cores allow for minimum winding resistance and efficient assembly. Long legs promote low and controlled leakage inductance and are useful for high voltage applications.

EC cores have standard channels for clamping assemblies. Plain bobbins, printed circuit bobbins and clamps are available for most sizes.

Magnetics EC cores are typically used in differential mode inductor and power transformer applications.

EER Cores

EER cores are an economical choice for transformers and inductors. The round center leg offers the advantage of a shorter winding path length than winding around a square center leg of equal area.

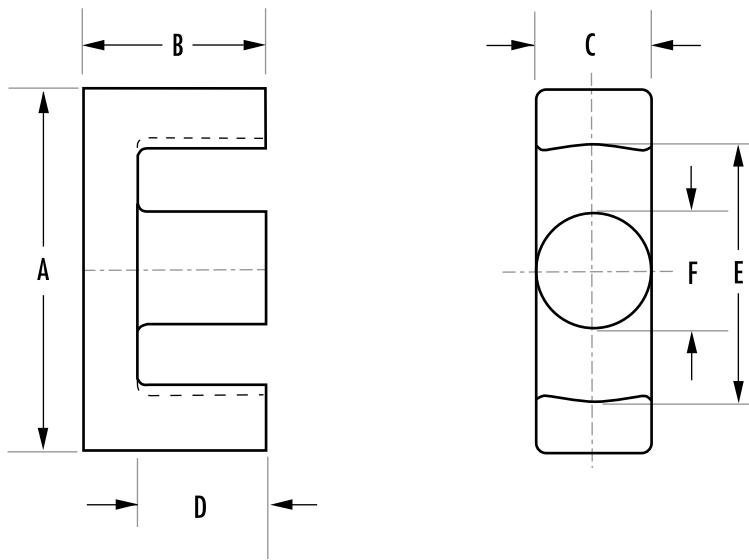

Differential mode inductors and power transformers are typical applications for Magnetics EER cores.

Block Cores

Ferrites can be pressed in block form and then machined into intricate shapes. Where large sizes are required, it is possible to assemble them from two or more smaller machined or pressed sections; the variety of sizes and shapes becomes limitless.

Features of Magnetics ferrite blocks include low porosity, extreme hardness, uniform physical properties, high density and ease of machining. J material offers high permeability; R material is suitable for power applications.

EP Cores

EP cores are round center post cubical shapes which enclose the coil completely except for the printed circuit board terminals. This particular shape minimizes the effect of air gaps formed at mating surfaces in the magnetic path and provides a larger volume ratio to total space used. EP cores provide excellent shielding.

Typical applications for EP cores include differential mode and telecom inductors and signal transformers.

RS-DS Cores

Slab cores are the same as pot cores except for wider wire openings. A slab piece can be paired with a standard pot core round to make an RS combination, or two slabs can be paired for a double slab (DS).

The RS geometry offers most of the shielding of a pot core but with more space available for terminating leads. DS cores offer a good compromise between shielding and thermal management.

Typical applications for RS and DS combinations include low and medium power transformers, switched-mode power supplies, and multiple output converter and inverter transformers.

PQ Cores

PQ cores are designed specifically for switched mode power supplies. One result is an optimized ratio of volume to winding area and surface area, meaning that maximum inductance and winding area are possible with a minimum core size. The cores provide maximum power output with minimum assembled transformer weight and volume, in addition to taking up a minimum amount of area on the printed circuit board.

Assembly with printed circuit bobbins and one piece clamps is simplified. PQs provide a more uniform cross-sectional area, so they tend to operate with less pronounced hot spots than most other cores.

Typical applications include power transformers and power inductors.

RM Cores

RM cores are designed for wound assemblies with a square footprint for efficient use of PC board space. The wire openings allow space for multiple coil terminations and offer a balance between shielding and thermal performance.

Easy to assemble and adaptable to automation, completed units provide at least 40% savings in mounting area compared to a similar size pot core assembly.

Typical applications include differential mode inductors, power inductors, filter inductors, telecom inductors and broadband transformers.

Power Design

CORE GEOMETRIES

POT CORES

Pot cores, when assembled, nearly surround the wound bobbin. This aids in shielding the coil from pickup of EMI from outside sources. The pot core dimensions follow IEC standards so that there is interchangeability between manufacturers. Both plain and printed circuit bobbins are available, as are mounting and assembly hardware.

ROUND SLAB, DOUBLE SLAB & RM CORES
Slab-sided solid center post cores resemble pot cores, but have a section cut off on either side of the skirt. The additional openings allow larger wires to be accommodated and assist in removing heat from the assembly. RM cores are also similar to pot cores, but are designed to minimize board space, providing at least a 40% savings in mounting area. Printed circuit or plain bobbins are available. One-piece clamps permit simple assembly. Low profile is possible. The solid center post generates less core loss and minimizes heat buildup.

PQ CORES

PQ cores are designed specifically for switched mode power supplies. One result is an optimized ratio of volume to winding area and surface area, meaning that maximum inductance and winding area are possible with a minimum core size. The cores provide maximum power output with minimum assembled transformer weight and volume, in addition to taking up a minimum amount of area on the printed circuit board.

Assembly with printed circuit bobbins and one piece clamps is simplified. PQs provide a more uniform cross-sectional area, so they tend to operate with less pronounced hot spots than most other cores.

EC, ETD AND EER CORES

These shapes combine the benefits of E cores and pot cores. Like E cores, they have a wide opening on each side. This provides ample space for the large wires used for low output voltage switched mode power supplies. It also increases the flow of air which keeps the assembly cooler. The center leg is round, like that of the pot core. One of the advantages of the round center leg is that the winding has a shorter path length around it (11% shorter) than the wire around a square center leg with an equal area. This reduces the losses of the windings by 11% and

enables the core to handle a higher output power. The round center leg eliminates the sharp bend in the wire that occurs with winding on a square center leg.

E, ER AND PLANAR E CORES

E cores offer the advantage of simple bobbin winding and ease of assembly. A wide variety of standard lamination-size, metric and DIN sizes are available. E cores are a low-cost choice in designs that do not require self-shielding. Planar cores are the best selection for low profile applications. Copper traces that are layered in the printed circuit board are the windings in most planar applications. This type of design provides superior thermal characteristics, economical assembly, low leakage inductance, and consistent performance.

EP CORES

EP cores are round center post cubical shapes which enclose the coil completely except for the printed circuit board terminals. The particular shape minimizes the effect of air gaps formed at mating surfaces in the magnetic path and provides a larger volume ratio to total space used. Shielding is excellent.

TOROIDS

Toroids are the least expensive ferrite shape. Available in a variety of sizes, outer diameters of 2.54 mm – 140 mm, toroids have good self-shielding properties. The fact that the core is a solid with no sections to assemble makes it a good choice if mechanical integrity is important in a high vibration environment. Toroid cores are available uncoated or with an epoxy, nylon or Parylene coating.

CORE MATERIALS

POWER

Magnetics R, P, F, T and L materials provide superior saturation, high temperature performance, low losses and product consistency.

T material is ideal for consistent performance over a wide temperature range. Applications for T include: Automotive, Electronic Lighting, Outdoor LCD Screens, Mobile Handheld Devices and AC adapters and chargers.

Ferrite is an ideal core material for transformers, inverters and inductors in the frequency range 20 kHz to 3 MHz, due to the combination of low core cost and low core losses. Ferrites may be used in the saturating mode for low power, low frequency operation (<50 watts and 10 kHz). Ferrite cores may also be used in flyback transformer designs, which offer low core cost, low circuit cost and high voltage capability. Powder cores (MPP, High Flux, Edge®, Kool Mp®, Kool Mp® MAX, Kool Mp® Hf, and XFlux®) offer soft saturation, higher B_{max} , and superior temperature stability and are often the best choice for minimum size and robust performance in power choke, inductor, and flyback applications.

L material was formulated for high-frequency and high-temperature applications. L is designed for DC-DC converters, filters and power supplies that operate from 0.5 – 3.0 MHz. Curie temperature is high for a ferrite material at 280°C.

R material is an economical, low-loss choice for a broad range of applications.

P material offers similar properties to R material, but is more readily available in some sizes.

F material is an established material with a relatively high permeability and 210°C Curie temperature.

Power Supplies, DC-DC Converters, Handheld Devices, High Power Control (gate drive) and EMI Filters are just a few of the applications that are typical for Magnetics ferrite power materials.

FILTER

Magnetics high permeability materials are engineered for optimum frequency and impedance performance in signal, choke and filter applications.

J and W materials offer high impedance for broadband transformers and are suitable for low-level power transformers.

J material is a medium perm, general-purpose material.

J's properties are well suited both for EMI/RFI filtering and broadband transformers.

W material has set the industry standard for high perm materials. In filter applications, W perm has 20-50% more impedance below 1 MHz than J perm.

M material is Magnetics' highest permeability material at 15,000 μ . Applications for M include: EMI/RFI suppression filters, common mode chokes, signal processing, and broadband transformers.

LINEAR FILTERS AND SENSORS

Magnetics **C, E and V materials** offer excellent properties for low-level signal applications. These materials set the standard for high quality factor, long-term stability and precise and adjustable inductance. Applications for these materials include high Q filters, wideband transformers, pulse transformers and RLC tuned circuits.

Inductor Design

Ferrite E cores and pot cores offer the advantages of decreased cost and low core losses at high frequencies. For switching regulators, power materials are recommended because of their temperature and DC bias characteristics. By adding air gaps to these ferrite shapes, the cores can be used efficiently while avoiding saturation.

These core selection procedures simplify the design of inductors for switching regulator applications. One can determine the smallest core size, assuming a winding factor of 50% and wire current carrying capacity of 500 circular mils per ampere.

Only two parameters of the design applications must be known:

- (a) Inductance required with DC bias
- (b) DC current

1. Compute the product of LI^2 where:

$$\begin{aligned} L &= \text{inductance required with DC bias (millihenries)} \\ I &= \text{maximum DC output current + } 1/2 \text{ AC Ripple} \end{aligned}$$

2. Locate the LI^2 value on the Ferrite Core Selector charts shown. Follow this coordinate up to the intersection with the first core size curve. Read the maximum nominal inductance, A_L , on the Y-axis. This represents the smallest core size and maximum A_L at which saturation will be avoided.

3. Any core size line that intersects the LI^2 coordinate represents a workable core for the inductor if the core's A_L value is less than the maximum value obtained on the chart.

4. Required inductance L , core size, and core nominal inductance (A_L) are known. Calculate the number of turns using

$$N = 10^3 \sqrt{\frac{L}{A_L}}$$

where L is in millihenries.

5. Example: If $I_{MAX} = 8$ Amps; L , inductance required = 100 μ Henries
 $LI^2 = (0.100 \text{ mH}) \times (8^2 \text{ Amps}) = 6.4 \text{ millijoules}$

6. There are many ferrite cores available that will support the energy required. Any core size that the LI^2 coordinate intersects can be used at the A_L value shown on the chart.

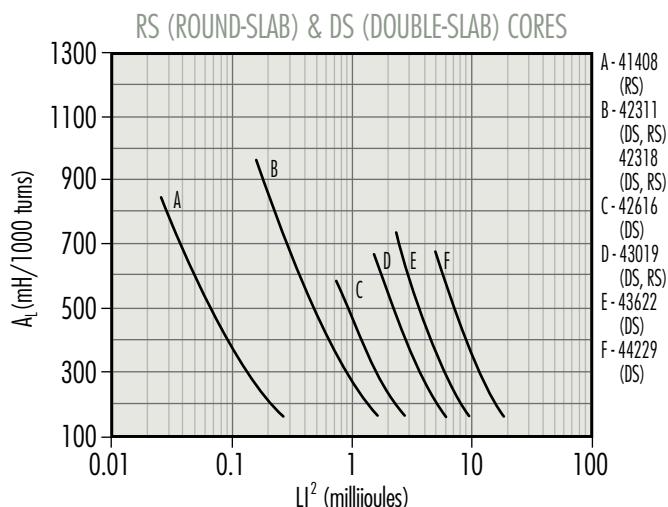

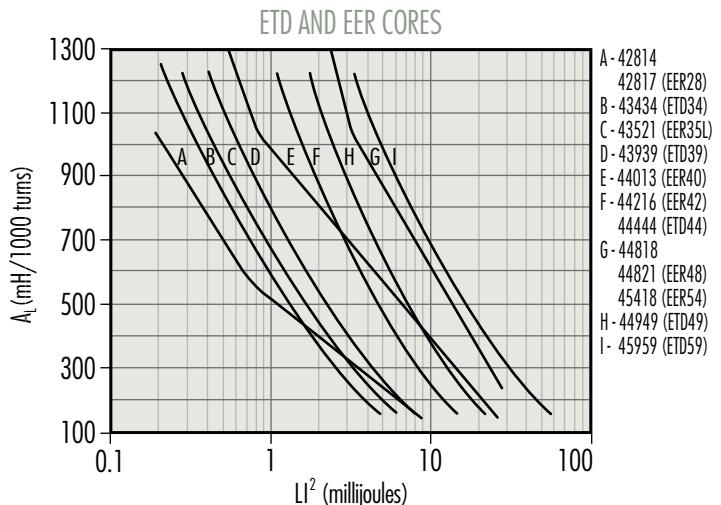

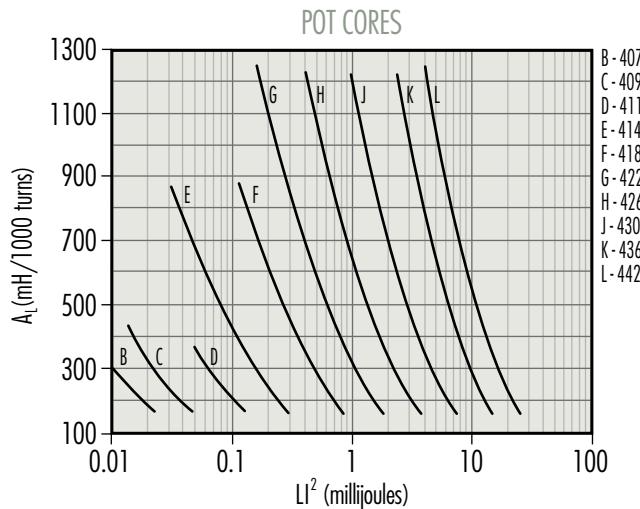

7. Some choices based upon an LI^2 value of 6.4 millijoules are:

Pot core 43622 $A_L = 400$ Double Slab 43622 $A_L = 250$
 PQ core 43220 $A_L = 300$ E core 44317 $A_L = 250$

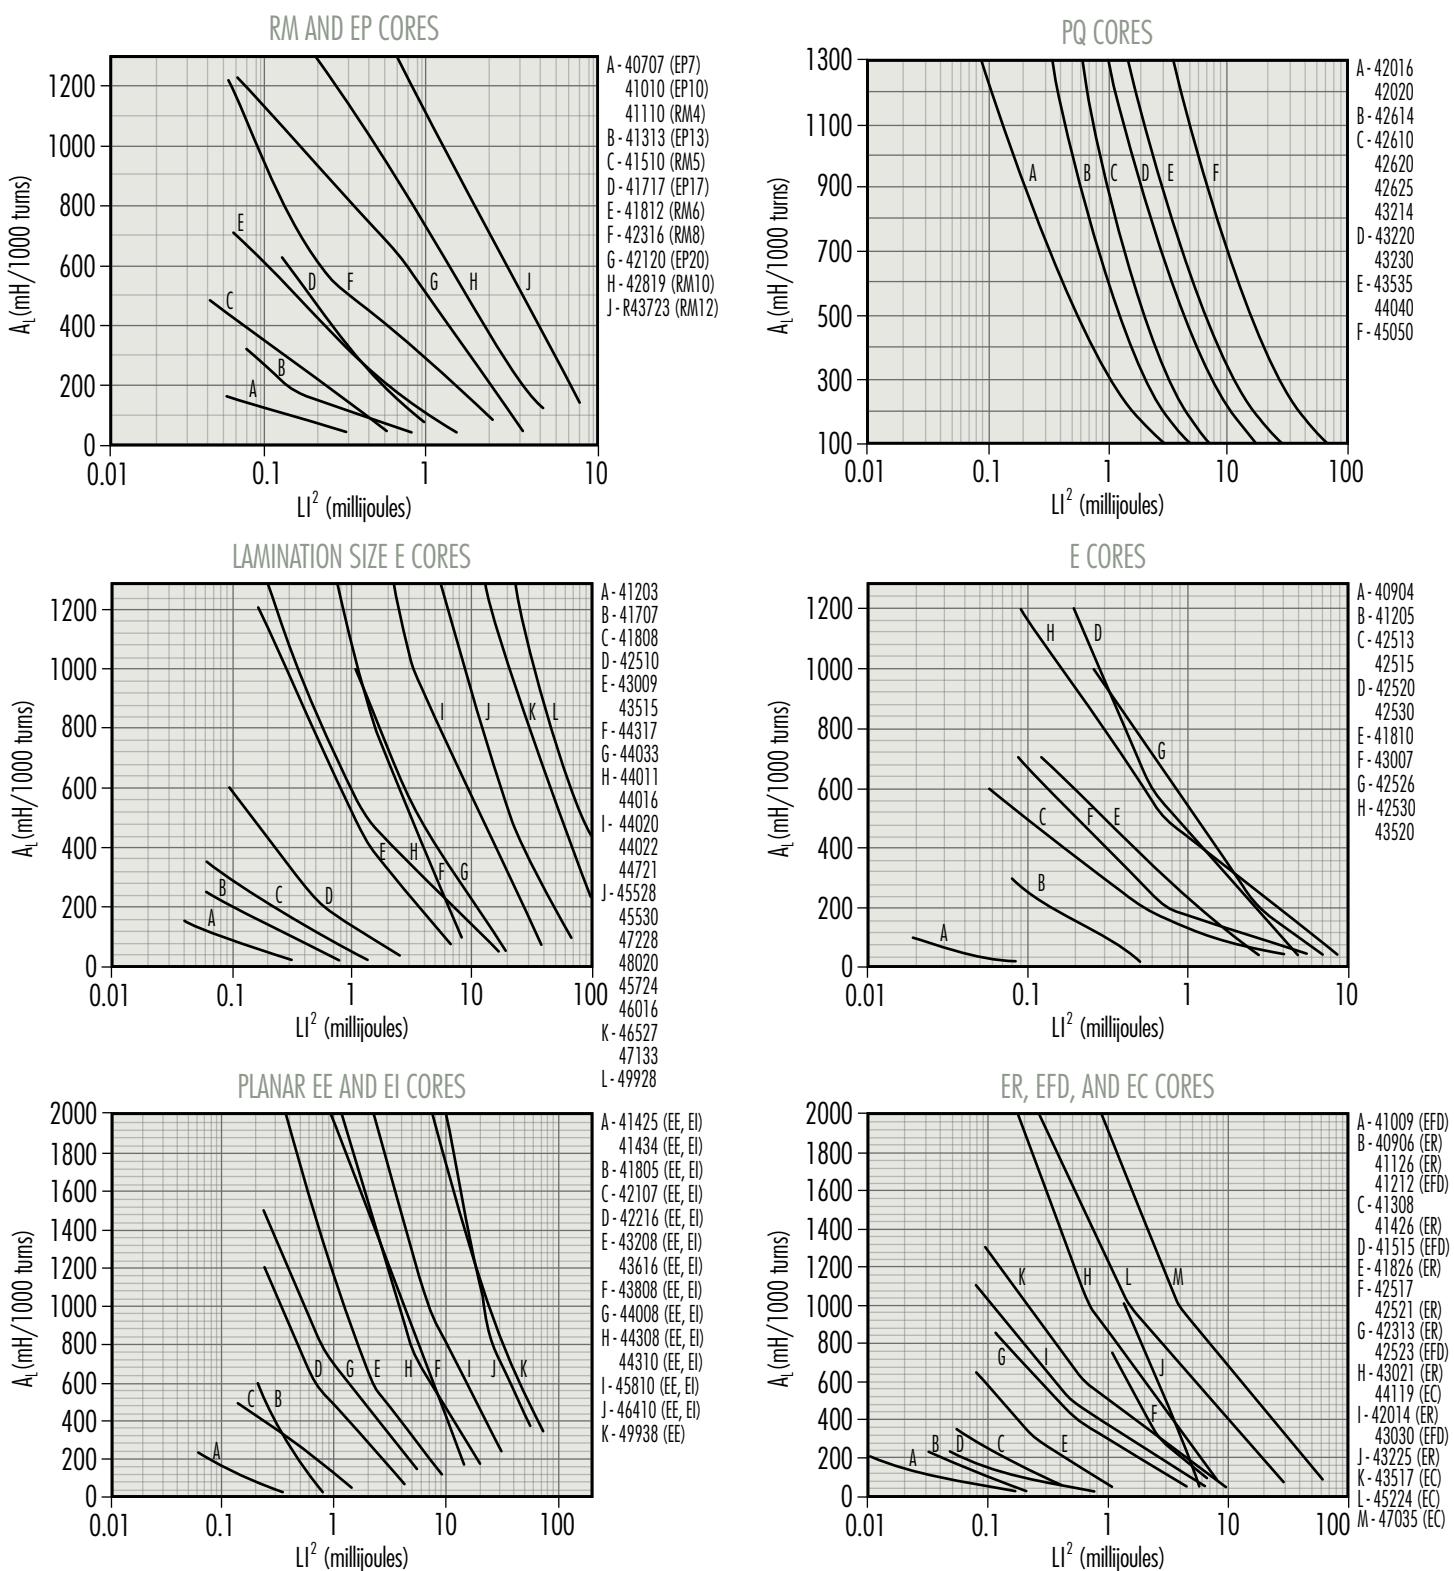

8. For the following A_L values the number of turns required is:

$A_L = 400, N = 16$ $A_L = 300, N = 19$ $A_L = 250, N = 20$

Make sure the wire size chosen will support the current and fit into the core set.

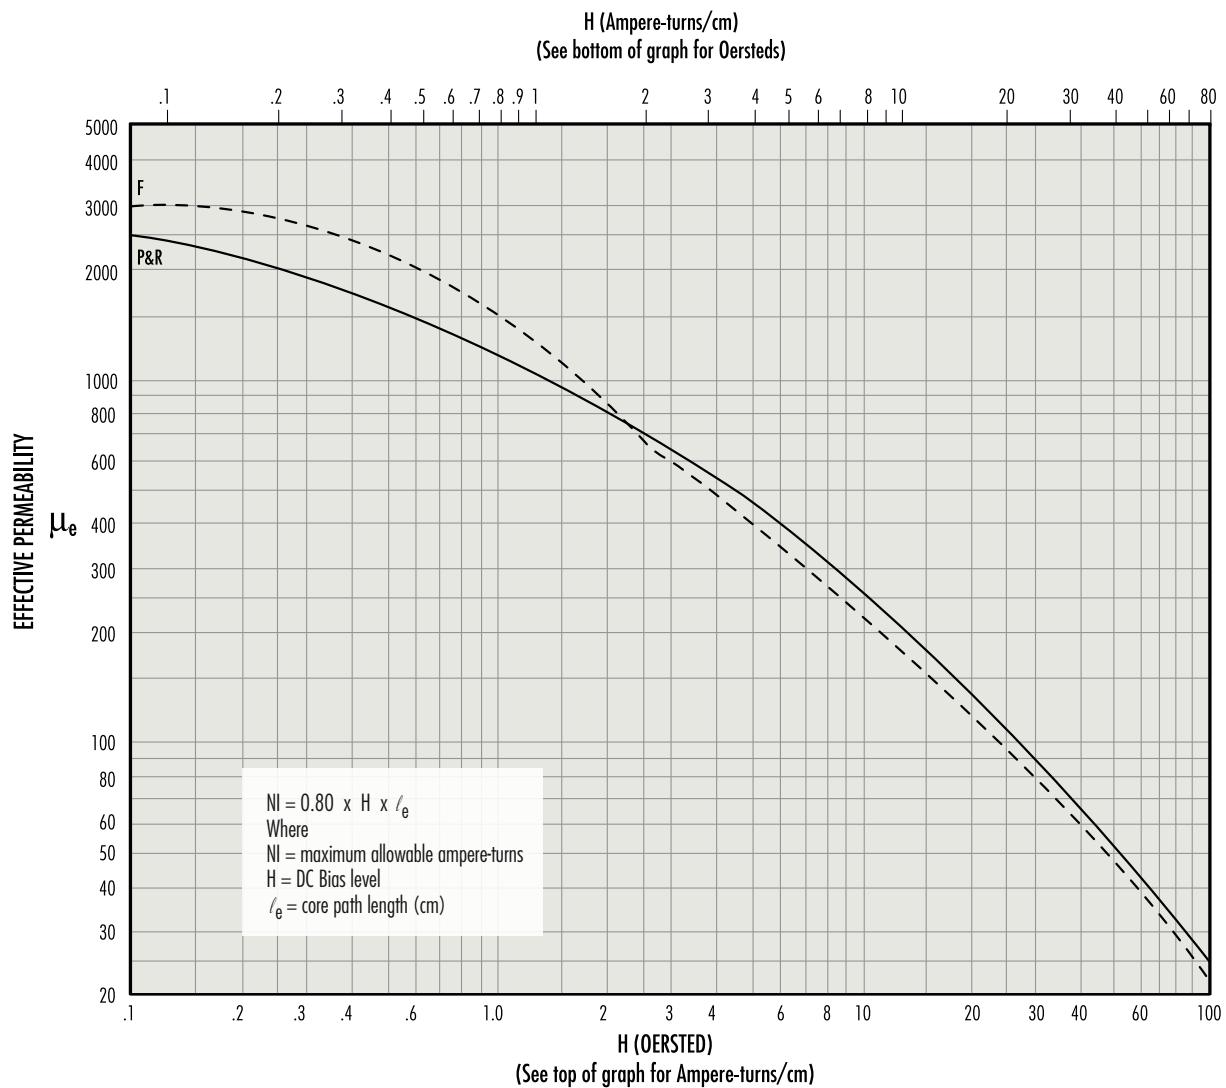

Inductor Design

Inductor Design

DC BIAS DATA — FOR GAPPED APPLICATIONS

The above curves are limit curves, up to which effective permeability remains constant. They show the maximum allowable DC bias, in ampere-turns, without a reduction in inductance. Beyond this level (see insert), inductance drops rapidly.

Example: How many ampere-turns can be supported by an R42213A315 pot core without a reduction in inductance value?

$$l_e = 3.12 \text{ cm} \quad \mu_e = 125$$

Maximum allowable $H = 25$ Oersted (from the graph above)

$$NI \text{ (maximum)} = 0.80 \times H \times l_e = 62.4 \text{ ampere-turns}$$

or (Using top scale, maximum allowable $H = 20 \text{ A}\cdot\text{T}/\text{cm}.$)

$$\begin{aligned} NI \text{ (maximum)} &= A\cdot T/\text{cm} \times l_e \\ &= 20 \times 3.12 \\ &= 62.4 \text{ A}\cdot\text{T} \end{aligned}$$

$$\mu_e = \frac{A_L \cdot l_e}{4 \pi A_e}$$

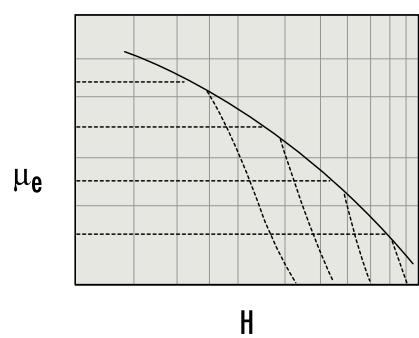

$$\frac{1}{\mu_e} = \frac{1}{\mu_i} + \frac{l_g}{l_e}$$

A_e = effective cross sectional area (cm^2)

A_L = inductance/1,000 turns (mH)

μ_i = initial permeability

l_g = gap length (cm)

Inductance falls off rapidly above the limit curve. The dashed lines illustrate the μ_e curve for individual gapped core sets.

Transformer Design

Magnetics offers two methods to select a ferrite core for a power application.

CORE SELECTION BY POWER HANDLING CAPACITY

The Power Chart characterizes the power handling capacity of each ferrite core based upon the frequency of operation, the circuit topology, the flux level selected, and the amount of power required by the circuit. If these four specifics are known, the core can be selected from the Power Chart on page 68.

CORE SELECTION BY WaAc PRODUCT

The power handling capacity of a transformer core can also be determined by its WaAc product, where Wa is the available core window area, and Ac is the effective core cross-sectional area. Using the equation shown below, calculate the WaAc product and then use the Area Product Distribution (WaAc) Chart to select the appropriate core.

$$WaAc = \frac{P_o D_{cma}}{K_t B_{max} f}$$

WaAc = Product of window area and core area (cm^4)

P_o = Power Out (watts)

D_{cma} = Current Density (cir. mils/amp) Current density can be selected depending upon the amount of heat rise allowed. 750 cir. mils/amp is conservative; 500 cir. mils is aggressive.

B_{max} = Flux Density (gauss) selected based upon frequency of operation. Above 20 kHz, core losses increase. To operate ferrite cores at higher frequencies, it is necessary to operate the core flux levels lower than ± 2 kG. The Flux Density vs. Frequency chart shows the reduction in flux levels required to maintain 100 mW/cm³ core losses at various frequencies, with a maximum temperature rise of 25°C for a typical power material, Magnetics P material.

A_c = Core area in cm^2

V = Voltage

f = frequency (hertz)

I_p = Primary current

K_t = Topology constant

I_s = Secondary current

(for a space factor of 0.4)

N_p = Number of turns on the primary

Flyback = 0.00033 (single winding)

N_s = Number of turns on the secondary

TOPOLOGY CONSTANTS K_t

Forward converter = 0.0005

Push-Pull = 0.001

Half-bridge = 0.0014

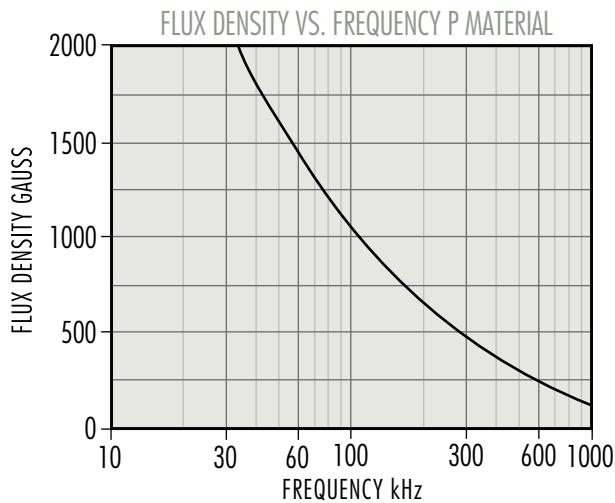

Full-bridge = 0.0014

Flyback = 0.00033 (single winding)

Flyback = 0.00025 (multiple winding)

For individual cores, WaAc is listed in this catalog under "Magnetic Data."

The WaAc formula was obtained from derivations in Chapter 7 of A. I. Pressman's book, "Switching Power Supply Design. Choice of B_{max} at various frequencies, D_{cma} and alternative transformer temperature rise calculations are also discussed in Chapter 7 of the Pressman book.

Once a core is chosen, the calculation of primary and secondary turns and wire size is readily accomplished.

$$N_p = \frac{V_p \times 10^8}{4BA_c f} \quad N_s = \frac{V_s}{V_p} N_p$$

$$I_p = \frac{P_{in}}{V_{in}} \quad I_s = \frac{P_{out}}{V_{out}}$$

$$KWA = N_p A_{wp} + N_s A_{ws}$$

Where

A_{wp} = primary wire area

A_{ws} = secondary wire area

Assume $K = .4$ for toroids; .6 for pot cores and E-U-I cores

Assume $N_p A_{wp} = 1.1 N_s A_{ws}$ to allow for losses and feedback winding

$$\text{efficiency } e = \frac{P_{out}}{P_{in}} = \frac{P_{out}}{P_{out} + \text{wire losses} + \text{core losses}}$$

$$\text{Voltage Regulation (\%)} = \frac{V_{no\ load} - V_{full\ load}}{V_{full\ load}} \times 100$$

Ferrite Core selection listed by typical Power Handling Capabilities (Chart is for Power Ferrite Materials, F, P, R, L and T, Push-Pull Square wave operation)

Wattage values shown above are for push-pull converter design. De-rate by a factor of 3 or 4 for flyback. De-rate by a factor of 2 for feed-forward converter.
Example: For a feed-forward converter to be used at 300 watts select a core that is rated at 600 watts based on the converter topology.

Note: Assuming core loss to be approximately 100 mW/cm³, B Levels used in this chart are:

@ 20 kHz - 200 mT, 2000 gauss; @ 50 kHz - 130 mT, 1300 gauss; @ 100 kHz - 90 mT, 900 gauss; @ 250 kHz - 70 mT, 700 gauss

Other Products from Magnetics

POWDER CORES

Powder cores are excellent as low loss inductors for switched-mode power supplies, switching regulators and noise filters. Most core types can be shipped immediately from stock.

Magnetics **Kool Mp®** powder cores exhibit low losses at elevated frequencies. Kool Mp is available in 7 permeabilities and a variety of core types for maximum flexibility. Toroids offer compact size and self-shielding. E cores, U cores, EQ cores, and LP cores afford lower cost of winding, use of foil windings or helical windings, and ease of fixturing. For very high current applications, very large cores and structures are available including toroids up to 165 mm, large E cores, U cores, stacked shapes, and blocks.

Magnetics **Kool Mp® MAX** powder cores offer 50% better DC bias performance than standard Kool Mp material. Available in 7 permeabilities from 14 μ to 90 μ including toroids, blocks, U cores and E cores.

Magnetics **Kool Mp® Hf** powder cores are the best option for achieving superior efficiency in medium and high current power inductors and are available in 26 μ , 40 μ and 60 μ .

Magnetics **XFlux®** powder cores are made from 6.5% silicon iron powder for very high saturation flux density, comparable with High Flux. XFlux is available in 7 permeabilities from 19 μ to 125 μ and multiple shapes including toroids, E cores, block cores, EQ cores, LP cores, and EER cores.

Magnetics **High Flux** powder cores exhibit very high resistance to saturation at high current. High Flux is available in 7 permeabilities from 14 μ to 160 μ and over 30 sizes. Shapes include toroids, EQ cores, LP cores, and EER cores.

Magnetics **Edge®** powder cores are the best option for achieving smallest package size in high frequency, current-limited power inductors and are available in 5 permeabilities from 19 μ to 125 μ .

Magnetics **Molypermalloy (MPP)** powder cores have extremely low core losses, highest Q, and best temperature stability compared with other materials. Standard cores include either temperature stabilized (guaranteed flat as wide as -65°C to 125°C for stable operation) or standard stabilization. MPP toroidal cores are available in 10 permeabilities from 14 μ to 550 μ and sizes identical to High Flux.

TAPE WOUND CORES

Strip wound cores are made from high permeability magnetic strip alloys of nickel-iron (80% or 50% nickel), and silicon-iron. The alloys are known as Orthonol®, Permalloy 80, 48 Alloy and Magnesil®. Tape Wound Cores are produced as small as 0.438" OD in hundreds of sizes. For a wide range of frequency applications, materials are produced in thicknesses from ½ mil (0.013 mm) through 4 mils (0.102 mm). Cases are robust nylon and aluminum boxes, rated for 200°C continuous operation and 2,000 minimum voltage breakdown.

Tape wound cores are useful for both power and signal circuits in harsh environmental conditions where robust component operation is essential to achieve high reliability.

BOBBIN CORES

Bobbin cores are miniature tape cores made from ultrathin (0.000125" to 0.001" thick) strip material wound on nonmagnetic stainless steel bobbins. Bobbin cores are generally manufactured from Permalloy 80 and Orthonol®. Covered with protective caps and then epoxy coated, bobbin cores can be made as small as 0.05" ID and with strip widths down to 0.032". Bobbin cores can switch from positive to negative saturation in a few microseconds or less, with very high peak impedance (relative permeability) while not saturated, making them ideal for analog logic elements, magnetometers, and pulse transformers.

Bobbin cores are also useful for analog counters, timers, magnetic sensors, and other analog circuits in harsh environmental conditions where robust and reliable operation is essential.

NANOCRYSTALLINE CORES

Nanocrystalline cores are made from amorphous metal which is annealed to create a uniform nanocrystalline microstructure. Sizes include toroids and split cores from 5 mm to 145 mm, and durable cases are available in polyester (<130°C) and rynite polyester (<155°C). Nanocrystalline cores are a choice solution for applications such as common mode chokes and current transformers as they exhibit high permeability, low power loss, and high saturation.

AMORPHOUS CORES

Amorphous cores are made from metallic glass materials with an amorphous atomic structure, which creates higher resistivity than nanocrystalline cores. Amorphous cores offer excellent frequency response and efficiency, and they are a choice solution for high frequency, low loss applications. Magnetics offers amorphous cut cores (C shape) from 51 mm to 131 mm, with toroids and split cores available upon request.
